FEATURES OF TOPS AND THEIR CORRECT USE

MARBLES AND GRANITES

Marbles and granites are natural stones that come out from natural proceedings that last millions of years.. Any slab used for your top can have differences in nuance, small holes due to porosity , less or more evident veins, that can be wider or slimmer, and irregular stains, darker or lighter, smaller or wider. These are not defects but normal feature of the stone, so that there's never one slab of marble like another one .

Cleaning and maintenance:

Any part in marble and granite has been originally treated with anti-stain detergent and wax. For daily use, clean at once with a soft cloth any drop of coffee, lemon, orange, tomato , traces of cosmetics and anything acid. For cleaning, use a normal product for marble and granites and dry at once with a soft cloth. For having these materials shiny, use products that easily can be found in any shop.

RESINMARBLE

Composite slabs with 90% of marble chips, selected for nuance and worth, that are mixed with chemical resins.

Micro-holes on the surface or flakes of different colour are due to the work proceedings, and therefore are not to be considered as defects

Cleaning and maintenance as for marbles and granites.

QUARTZ

Innovative technological material, with remarkable physical- mechanical qualities, that comes from particles of quartzite, silicium grits and polyester resins mixed together and then compressed.

Cleaning and maintenance as for marbles and granites.

CRYSTAL GLASS

The well-known features of resistance to external agents, along with its undisputed elegance, are ideal for its use in the world of bathroom furniture. For fitting the crystal-made top , use non-acetic neutral silicone.

Cleaning and maintenance of crystal glass:

Use common detergents for glass. For hard stains due to limestone and soaps, clean with anti-limestone detergents as vinegar, viakal, ajax.

Clean with warm water then dry with a soft cloth.

MAT/POLISHED TECNORIL®

Slabs of solid tech material and not porous of acrylic resin and tri-hydrate of aluminium, that comes from bauxite. Polished Tecnoril is coated with an additional polyester /acrylic resin film that supports the glazing proceeding. The smooth sensation of Tecnoril when you touch it ,that gives the idea of a natural element, gives an unexpected sensation of pleasance. Tecnoril has a high resistance to acids , basic elements, stains, scratches, grazes, wear and tear of time and the typical stress due to daily use.

Thanks to its features , Tecnoril is , among the solid surfaces, in the highest positions -for chemical and mechanical resistances- and these features are continuously tested and stressed in accordance to the current european legislations.

Cleaning and maintenance of mat Tecnoril:

Surfaces can easily be cleaned with water and dried with a soft cloth, and in case of hard stains, cleaned with a liquid soap and soft. And soft sponge.

In case of stains due to limestone, use an anti-limestone detergent as viakal or ajax or vinegar. Then clean with warm water and dry with a soft cloth.

In case of stains due to lipstick, felt-tipped pen, grease, use a solution with warm water and 10% ammonia, then clean with a soft cloth.

Do not lean lit cigarettes on the top as well as do not cut anything on the top, but always use a a chopboard.

Cleaning and maintenance for polished Tecnoril:

For removing the most of the stains, the dirt and limestone and not damaging the shiny surfaces of Tecnoril, we suggest the use of a solution of water and soap or common non -abrasive detergents with a non -abrasive sponge or soft cotton cloth, carefully cleaning with water before drying with a soft cloth. Do not leave anything red-hot on the top as well as do not leave lit cigarettes on the top. Do not cut anything on the top but use a a chopboard between the object to cut and the top.

It's possible to recover deep scratches, light splits, super hard stains with normal maintenance. If the geacrill filmthat coats the surface has not been damaged in its total thickness, please call a specialized centre that will sand-paper with a very thin abrasive paper (grain 800-1000) as long as it has erased the scratch and levelled the surface. For returning to the original brilliance, please use a polish cream (the same cream used for cars), following instructions.

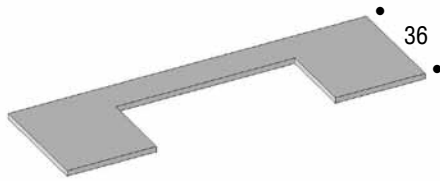

VENEERED, MELAMINE AND LACQUERED TOPS:

Veneered tops require a higher care than the other materials, but for preserving the original nuance and colours please place veneered parts where are not directly exposed to sun rays and please remove at once any drop of water or liquid from its surface.

Cleaning and maintenance of veneered, melamine and lacquered tops:

Use only a moistened soft cloth, and avoid any detergent, soap and abrasive material.
